

PIVOT Data Integration Profile

Important Considerations:

The installation within this procedure requires installation of the PIVOT data installation tool on your primary e-automate server. Your systems administrator will need to provide a windows/windows active directory login with local administration rights to allow the PIVOT data integration tool to run within windows scheduled task. When performing the installation of the PIVOT Data Integration Tool, it is required that you use this windows account (or newly created windows account), to login to perform the installation.

It is best practice not to use your Azure Active Directory Global Administrator or Active Direct Domain Administrator account to perform e-Automate or PIVOT administration. We recommend creating a e-Automate administration account such as "EA_Admin" that allows a higher-level privilege to administrator your e-automate application_server.

If using SQL instance, then the SQL server format would be: 192.168.1.10/INSTANCE

Please keep this document. This completed document will be needed when your PIVOT Auto Data Extraction Installation is performed.
